POLS 5003: Problem Set # 2
Team Members: Christopher Eubanks, Dongkyu Kim, and Desmond Wallace
Date: March 3, 2014

The dataset `Obama.dta` is a subset of the 2008 American National Election Survey. We will use it to examine attitudes toward Barack Obama, using the feeling thermometer `obama`.

```
> # Setup
> require(foreign)
> obama <- read.dta("Obama.dta")
> var.labels <- attr(obama,"var.labels")
> data.key <- data.frame(var.name=names(obama),var.labels)
> data.key

  var.name                        var.labels
1    obama         Obama feeling thermometer
2      age                      Years of age
3   income          Household income, $000s
4     educ               Years of education
5   female                            Female
6    black       R self-identifies as black
7      dem   R self-identifies as Democrat
8      rep R self-identifies as Republican
```

1. Suppose we hypothesize that a respondent's income affects her or his attitudes toward Obama, that those with higher incomes will express cooler feelings toward him. Controlling for age, education, gender, race, and partisanship, is this hypothesis supported? How do you know?

```
> m1 <- lm(obama ~ income + age + educ + female + black + dem + rep, data=obama)
> summary(m1)

Call:
lm(formula = obama ~ income + age + educ + female + black + dem +
    rep, data = obama)

Residuals:
    Min      1Q  Median      3Q     Max
-75.815 -11.761   3.395  12.594  66.320

Coefficients:
            Estimate Std. Error t value Pr(>|t|)

Residual standard error: 21.03 on 1850 degrees of freedom
  (465 observations deleted due to missingness)
Multiple R-squared:  0.3779,      Adjusted R-squared:  0.3756
F-statistic: 160.6 on 7 and 1850 DF,  p-value: < 2.2e-16
```

According to the results above, the coefficient for `income`, representing household income in thousands of dollars, is -0.0333. This means that for every $1,000 increase in household income, respondents' feelings toward Obama will decrease by three and one-third points. This coefficient is statistically significant at $\alpha = 0.01$. Based on these results, there is sufficient support for the hypothesis that a respondent's income affects their attitudes towards President Obama.

2. Suppose we think Democrats' feelings toward Obama will be less influenced by their incomes than others' feelings are. Is there support for this conditional hypothesis? How do you know?

```
> m2 <- lm(obama ~ income + age + educ + female + black
+            + dem + rep + dem:income, data=obama)
> summary(m2)

Call:
lm(formula = obama ~ income + age + educ + female + black + dem +
    rep + dem:income, data = obama)

Residuals:
   Min     1Q Median     3Q    Max
-76.67 -11.64   3.05  12.73  69.79

Coefficients:
             Estimate Std. Error t value Pr(>|t|)
(Intercept) 61.666783   3.271568  18.849  < 2e-16 ***

---
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 20.97 on 1849 degrees of freedom
  (465 observations deleted due to missingness)
Multiple R-squared:  0.3814,      Adjusted R-squared:  0.3787
F-statistic: 142.5 on 8 and 1849 DF,  p-value: < 2.2e-16
```

According to the results above, the coefficient for `income`, representing household income in thousands of dollars, is -0.0535.This means that for every \$1,000 increase in household income, there is a 53.84 point decrease in Obama's feeling thermometer for respondents who self-identify as non-Democrats, hlding all other factors constant. For respondents who self-identify as Democrats, there is a 14.33 point increase for every \$1,000 increase, again holding all other factors constant. Not only doess `income` remain statistically significant in this model, the included interaction term is significant when $\alpha = 0.01$. Based on this information, there is sufficient evidence to conlcude there is support for the conditional hypothesis. In other words, Democrats' feelings toward Obama are less influenced by their incomes than others' feelings are.

3. Does income have a statistically significant effect on the feelings toward Obama of those who aren't Democrats? On the feelings of Democrats? Report the estimated effect and p-value for each.

```
> obama$nondem <- 1-obama$dem
> m3 <- lm(obama ~ income + age + educ + female +
+             black + nondem + rep + nondem:income, data=obama)
> summary(m3)

Call:
lm(formula = obama ~ income + age + educ + female + black + nondem +
    rep + nondem:income, data = obama)

Residuals:
   Min     1Q Median     3Q    Max
-76.67 -11.64   3.05  12.73  69.79
```

```
Coefficients:
              Estimate Std. Error t value Pr(>|t|)

---
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 20.97 on 1849 degrees of freedom
  (465 observations deleted due to missingness)
Multiple R-squared:  0.3814,       Adjusted R-squared:  0.3787
F-statistic: 142.5 on 8 and 1849 DF,  p-value: < 2.2e-16
```

According to the results from question #2, respondents who self-identify as non-Democrats, household income does have a statistically significant effect on their feelings towards Obama, with a coefficient value of -0.0333 and a p-value less than $2x10^{-16}$, well below $\alpha = 0.05$. In order to answer the second part of the question, we had to change the reference level of the model, so now we can show the effect income has on respondents self-identified as Democrats. According to this new model, household income does *not* have a statistically significant effect on Democrats' feelings towards Obama, with a coefficient value of 0.0143 and a p-value of 0.4285, well above $\alpha = 0.05$.

4. Suppose we were really more interested in how being a Democrat affects feelings towards Obama. What effect does income have on this effect? Graph your answer and insert the graph in your LATEX file.

```
[1]  61.650052314  -0.053464096  -0.029886126  -0.003878492   4.422827025
[6]  17.066358972  10.496633740 -16.031033308   0.067896264
```

According to the figure below, it appears that household income has a positive effect on the coefficient dem. In other words, as income increases, the effect being a self-identified Democrat has on respondents' feelings towards President Obama increases as well.

Figure 1: Effect of Income on the Effect Being A Democrat Has on Respondents' Feelings Towards Obama
